

DHK INSTRUCTIONS

1. GENERAL

- The drum alarm alerts when a full drum is detected by the float switch sensor.

2. SETUP

- Remove the cover and connect the 9V battery to the battery snap.
- Install in the drum to be monitored using the thumbscrew mount.

3. OPERATION

- The circuit only draws power when actually alarming. Therefore the battery will typically last many years.
- The blue pushbutton tests the circuit.

4. OTHER POINTS NOT COVERED

- The float guard can be unscrewed to inspect or clean the float switch.
- There is an option for a circuit board to silence the buzzer, and provide low battery alert but the base model does not include this feature.
